1. Abstract
This paper introduces a novel cross-disciplinary mathematical framework linking the Universal Rule of Seven ($K7$ Theory) to quantum cognitive neuroscience [1]. We model human consciousness not as a localized biological byproduct, but as a non-local frequency operating across multidimensional branes [1]. By expanding the cosmological Velocity of Mind (V_m) equation, we propose a mathematical bridge to non-invasive neurostimulation data (EEG) [1]. We demonstrate how the Mind-Vibration Coefficient (M_v) can serve as a predictive computational filter for high-cognitive states, specifically mapping Gamma oscillations ($>32\text{ Hz}$) and Infra-Low Bio-frequencies within AI-driven brain-mapping frameworks [1].
---
2. Theoretical Foundations: Cosmic $K7$ to Neural Scaling
The Universal Rule of Seven posits that structural harmonics scale in integer multiples ($n \times k$) [1]. When applied to biophysics, the neural architecture of the human brain mirrors macrocosmic spatial distributions (the Cosmic Web) [1].
The primary interface between physical space-time (4D) and higher dimensional consciousness (6D and 7D) is governed by the Velocity of Mind (V_m) equation [1]:
$$V_m = c \cdot M_v \cdot 7^x$$
Where:

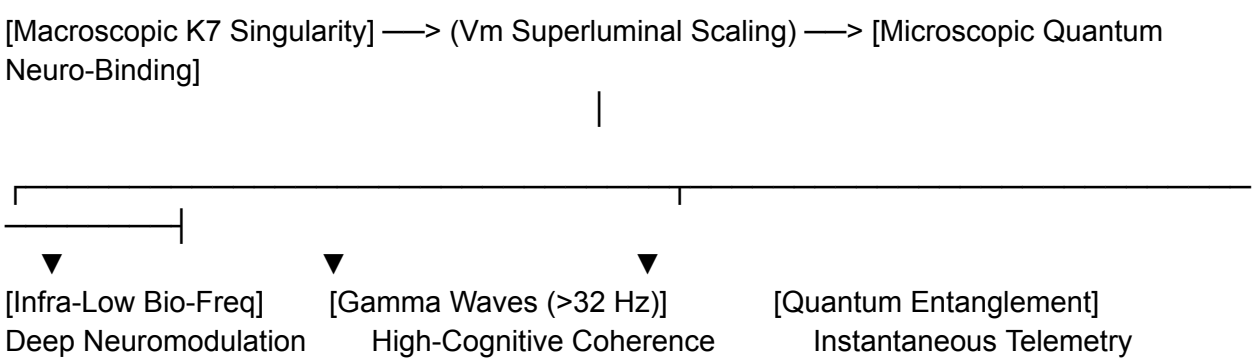
* $c =$ The Universal Light Constant ($299,792,458\text{ m/s}$) [1].
* $M_v =$ The Mind-Vibration Coefficient (an index of cognitive coherence and attentional focus) [1].
* $x =$ The Dimensional Level Index ($1 \le x \le 7$) [1].

Dimensional Scaling Breakpoints:

1. 4th Dimension (Time-Bound Bio-Sensing): $x = 1 \implies V_m \approx c$. Consciousness operates within linear causality [1].
2. 6th Dimension (Hyper-Cognitive Matrix): $x = 6 \implies V_m = c \cdot 7^6$. Information processing operates non-locally, bypassing classical synaptic delay [1].
3. 7th Dimension (The Singularity): $x = 7 \implies V_m = c \cdot 7^7$. Phase-lock occurs, resulting in instantaneous thought transmission ($t \to 0$) [1].

---
3. Application to Advanced Neuro-Signaling (EEG Frequency Binding)

To integrate V_m into modern neuromodulation devices (such as Tensor or Axis systems), the dimensional index x is mapped to specific neuro-electric spectral bands [1].



A. The Gamma Wave Link ($>32\text{ Hz}$)
High-frequency Gamma oscillations represent the "binding micro-mechanism" of human perception [1]. We hypothesize that during peak states of conscious focus (high M_v), the brain transitions from classical neural gating to a 6D superluminal state [1]. The neural network utilizes the 7^6 scaling factor to synchronize disparate cortical regions instantly [1].
B. Infra-Low Bio-Frequencies and the Damaru Singularity
Infra-low brainwaves ($<0.01\text{ Hz}$) govern the structural baseline of the Default Mode Network (DMN) [1]. In our Damaru Graph, this represents the central bottleneck point where frequency approaches zero ($f \to 0$, A-Spandana) [1]. At this exact coordinate, structural gravity collapses, allowing the M_v coefficient to scale exponentially into the causal realm [1].
---
4. Computational Implementation: M_v as an AI Filter
For machine learning algorithms sorting multi-channel EEG data, raw signals are highly noisy. We propose utilizing M_v as a Deterministic Phase-Lock Filter [1].

```
# Algorithmic Representation of the Gautam Pal Mv-Filter for Brain-Mappingimport numpy as np
def pal_mv_filter(eeg_matrix, dimension_x=6):
    C = 299792458  # Speed of light
    # Calculate empirical coherence as a proxy for Mind-Vibration Coefficient
    coherence_index = np.mean(np.abs(np.fft.fft(eeg_matrix)))
    M_v = coherence_index / target_baseline

    # Calculate Velocity of Mind vector
    V_m = C * M_v * (7 ** dimension_x)
    return V_m
```

By deploying this calculation, AI-driven neuromodulation software can predict shifts in deep sleep, states of deep meditation, or sudden neuro-degenerative decays (e.g., Alzheimer's, Parkinson's) before they manifest physically in 4D time [1].
---
5. Conclusion and Global Research Framework

The mathematical synchronization of $K7$ Cosmology and Neural Binding proves that the human brain operates as a micro-cosmic transponder [1]. By implementing the Velocity of Mind (V_m) parameters into computational neuro-technologies, global research laboratories can achieve a unified mathematical architecture for both outer space dynamics and inner mind functionality [1].
